

GIT AND GITHUB

- install git (<https://git-scm.com/downloads>)
- create or signIn github Account (<https://github.com/>)
- create repository on github

Commands:

git init (initialize a new git repository in the current directory)

git status (Shows the current status of the Git repository, including which files have been modified, which files are staged for commit, and which files are untracked.)

git add . **Or git add -A** (Adds all modified and untracked files to the staging area, preparing them to be committed.)

git config --global user.name "yourName" (Sets the global Git configuration for the user's name) **one time**

git config --global user.email "yourEmail" (Sets the global Git configuration for the user's email) **one time**

git commit -m "your message" (Commits the changes that have been staged, creating a new commit with a message describing the changes made.)

git remote add origin "your repo link" **Or copy paste second last line** (Adds a remote repository to the local Git repository, allowing you to push your changes to a remote location.)

git push -u origin master (Pushes the committed changes to the remote

repository on the master branch. The **** -u **** flag sets the upstream branch for the current branch, allowing future pushes to be done with just git push.)

.....

After running the git push command, Git will prompt you to enter your GitHub username and password, unless you have set up SSH authentication. Enter your credentials and press enter. Once authenticated, Git will push your committed changes to the remote repository.

In the command git push -u origin master, "master" refers to the branch that you want to push your changes to on the remote repository. In this case, you are pushing the changes from your local "master" branch to the "master" branch on the remote repository.

Overall, this workflow initializes a new Git repository, stages and commits changes, adds a remote repository, and pushes the committed changes to the remote repository.

.....

COMMIT CHANGES:

git add <filename> Or \$ git add

. git commit -m "Commit

message" git push
